I-I Precautions in Using Aluminum Electrolytic Capacitors

Please note the following recommendations when use capacitors:

1. Electrolytic capacitors for DC applications require polarization .

Confirm the polarity before use . The circuit life may be shortened or the capacitor may be damaged if insert in reversed polarity . For use on circuits whose polarity is occasionally reversed , or whose polarity is unknown , use non-polar capacitors . Also note that the electrolytic capacitors cannot be used for AC applications .

2. Do not apply a voltage exceeding the capacitor's voltage rating.

If a voltage exceeding the capacitor's voltage rating is applied , the capacitor may be damaged by increased leakage current . When using the capacitor with AC voltage do not exceed the rated voltage .

3. Do not allow excessive ripple current passing.

Use the electrolytic capacitor at current value within the permissible ripple range . If the ripple exceeds the specified value , request capacitors for high ripple current applications .

4. Ascertain the operation temperature range .

Use the electrolytic capacitors according to the specified operation temperature range . Use at room temperature will ensure a longer life .

5. The electrolytic capacitor is not suitable for circuits which are charged and discharged repeatedly .

If used in circuits which are charged and discharged repeatedly , the capacitance value may drop or the capacitor may be damaged .

Please consult our engineering department for assistance in these applications .

6. When capacitors have been left unused for long time , use them only after due voltage treatments . Long storage of capacitors tends to rise their leakage current levels . In such cases , be sure to provide the necessary voltage treatment before use .

7. Be careful of temperature and time when soldering .

When soldering a printed circuit board with various components , care must be taken that the soldering temperature is not too high and that the dipping time is not too long .

Otherwise , there will be adverse effect on the electrical characteristics and insulation sleeve of electrolytic capacitors . In the case of small -size electrolytic capacitors , nothing abnormal will be occurred if dipping is performed at less than 260°C for less than 10 seconds .

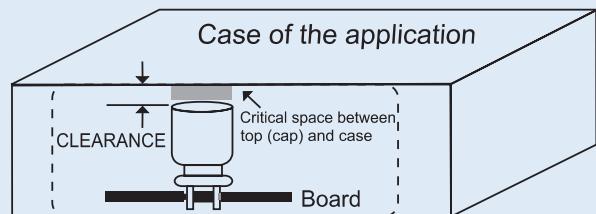

8. Cleaning circuit boards after soldering .

Halogenated hydrocarbon cleaning solvents are not recommended for use in cleaning capacitors supplied with exposed end seals . Where cleaning with a halogenated solvent is desired , capacitors should be ordered with an Epoxy-coated end seal .

9. Do not apply excessive force to the lead wires or terminals .

If excessive force is applied to the lead wires and terminals , they may be broken or their connections on the internal elements may be affected . (For strength of terminals , please refer to JIS C5102 and C5141 .)

10. Keep the following clearance between the vent of the capacitor and the case of the appliance . Do not block the operation of the vent , unless otherwise described on the catalogues or product specifications . The narrower clearance may adversely affect the vent operation and result in an explosion of the capacitor .

Case diameter	Clearance
ø 6.3 to ø 16 mm	2 mm minimum
ø 18 to ø 35 mm	3 mm minimum
ø 40 mm & up	5 mm minimum

- The description in this catalogue is subject to change without prior notice for product improvement . Therefore , please confirm the specification before ordering products .
- The general characteristics , reliability data , etc ., described in this catalogue should not be construed as guaranteed values , they are merely standard values .
- Before using the products , please read the notes in this catalogue carefully for proper use .

I-2 Technical Concepts

I.The material and structure of Electrolytic Capacitors

Electrolytic Capacitor is a simple module . It simply contains an insulator between relative conductors in an electrode. The major internal raw material contains an element constructed by an separator paper wrap around the anode foil and cathode foil , which is then impregnated with the electrolyte , inserted into an aluminum case and sealed.

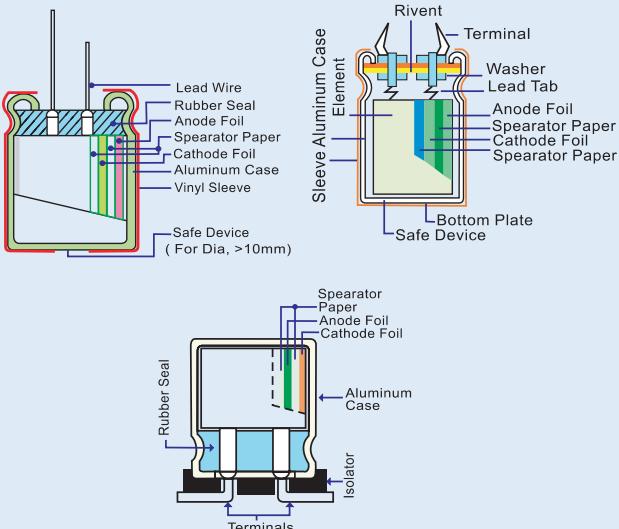

Fig.I-2

2. Production Processes

1. Etching :The process to increase surface area of aluminum foil by using chemical erosion or chemical corrosion method is called Etching .Normally chemical corrosion method uses the ripple current of electrolyte , combination of the liquid and temperature to determine the size, shape , and quantity of the dense network of microscopicchannels on the aluminum foil surface .
2. Forming :The production process of the anode aluminum foil of electrolytic capacitors is by anodic oxidation of the etched aluminum foil . The production of the cathode aluminum foil sometimes involves oxidation in special purposes .This anodic oxidation process is called Forming . Boric acid or organic acid is used for high voltage forming and phosphoric acid or ammonium adipate is used for low voltage forming in order to obtain stable natural oxide layer of Al_2O_3 .
3. Slitting :The cutting of the aluminum foil and separator paper according to the required length .
4. Winding :The stitching or cold welding of cut anode and cathode foils and tab terminal, and wrap the electrolytic paper in between the anode and cathode , then fix the end with glue or sticky tape , and attached leads is called the capacitor "element".
5. Impregnation :The process of eliminating the water from the elements by pressurizes or vacuum in order to soak the element with the electrolyte is called Impregnation .The elements fully filled with electrolyte is then centrifuged to remove excess electrolyte .
6. Assembly :The elements seal with rubber to stop the leakage of electrolyte then slip into a sleeve to form the final product .
7. Aging :The purpose of Aging is to repair the oxide film damage by recharging and electrolyte .

I-3 The Function of Electrolytic Capacitors

The electrolytic capacitors could be widely used in appliance (ie.TV , radio , audio equipment , watching machine and air conditioner.....etc .), computer equipment (mother board, image device & the peripherals such as the printer , drawing device, scanner etc) , communication equipment , estate equipment , measure instrument and also the industrial in strument , air plane , firebomb , satellite...etc. as a piloting equipment.

*According to the inflict electric wave & using purpose , it basically with some classified purposes as below :

I.DC Voltage :

- a. For Momentary High Voltage : For using to the impulse generator such as the shock wave resistance test of the heavy electric machine .
- b. For High Electric Current : For using to the welding machine , X-Ray facility , copy machine and discharge processing device .
- c. For DC High Voltage :The electrolytic capacitor and rectifier composing, a special DC high voltage been happened after charged , for using to the power of electronic microscope and accelerator .
- d. For Integration & Memory : For either memory circuit or compare circuit inside the calculator .

2.The DC voltage that with alternate ingredient :

- a. For Wave Filter : Combination with the chip resistor & inductor as a internet, to be past by DC current or some frequency to closure or decline some other frequency .
- b. For Bypass :A parallel track that outside from the circuit element , the IC (integrated circuit) has been rapidly developing in this years and thus a miniaturization or chip of electrolytic capacitors for bypass was conducted .
- c. For Coupling : Combination of the electrolytic capacitor , chip resistor and inductor and thus coupling together .
- d. For Arising of Toothed Wave : Composing of RC charge/discharge circuit through the electrolytic capacitor as well as the resistor and a toothed wave to be created by the RC charge/discharge circuit .
- e. For Reverse (Change) of Circuit :The equipment for change the AC voltage to DC voltage .

3. For AC voltage :

- a. For Power Improving : Connect the end loading of layout transporting & electrolytic capacitor for power improving .
- b. For Wave Filter : Prevention of external interference in SCR circuit , use the LC wave filter circuit to inhibit or erase the interference .
- c. For Phase Across : Phase change of the inductive electromotor (motor) with single phase .

I-4 Basic Electrical Characteristics

1. Capacitance (E.S.C.)

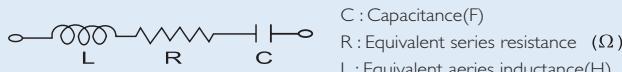

Fig.I-3 Simplified equivalent circuit diagram of an electrolytic capacitor

The capacitive component of the equivalent series circuit (equivalent series capacitance ESC) is determined by applying an alternate voltage of 0.5V at a frequency of 120 Hz.

Temperature dependence of the capacitance

The capacitance of an electrolytic capacitor depends on the temperature : with decreasing temperature , the viscosity of the electrolyte increases reducing its conductivity .The capacitance will decrease if the temperature decreases . Furthermore temperature drifts cause armature dilatation and therefore capacitance changes (up to 20% , depending on the series considered, from 0 to 80° C) .This phenomenon is more evident for electrolytic capacitors than for other types .

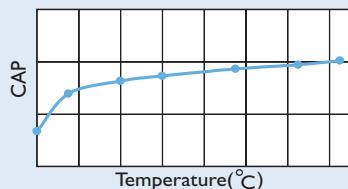

Fig. I-4 Capacitance change vs. temperature

Frequency dependence of the capacitance

The effective capacitance value is derived from the impedance curve , as long as the impedance is still in the range where the capacitance component is dominant .

$$C = \frac{1}{2\pi f Z}$$

C = Capacitance(F)
f = Frequency(Hz)
Z = Impedance(Ω)

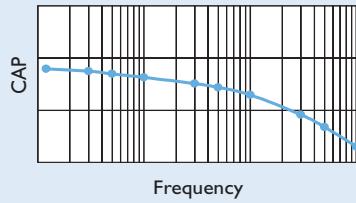

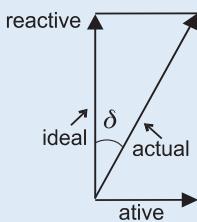

Fig. I-5 Capacitance change vs. frequency

2. Dissipation factor ($\tan \delta$)

The dissipation factor is the ratio between the active and the reactive power for a sinusoidal waveform voltage .It can be thought as a measurement of the gap between an actual and an ideal capacitor .

$$\text{D.F.} = \tan \delta \times 100 (\%) = \omega CR \times 100 (\%) = 2\pi f CR \times 100 (\%)$$

where: R = Equivalent Series Resistance
C = Equivalent Series Capacitance
 $\omega = 2\pi f$

Fig. I-6

The $\tan \delta$ is measured with the same set up as for the series capacitance ESC .

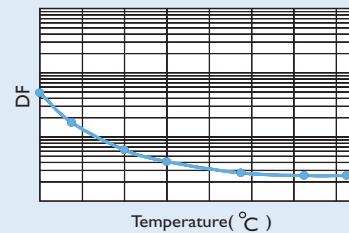

Fig. I-7 Dissipation factor vs. temperature

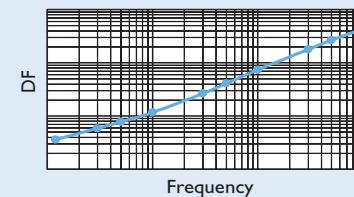

Fig. I-8 Dissipation factor vs. frequency

3. Equivalent series resistance (E.S.R.)

The equivalent series resistance is the resistive component of the equivalent series circuit .The ESR value depends on frequency and temperature and is related to the $\tan \delta$ by the following equation :

$$\text{ESR} = \frac{\tan \delta}{2\pi f \text{ESC}} \quad \begin{aligned} \text{ESR} &= \text{Equivalent Series Resistance} (\Omega) \\ \tan \delta &= \text{Dissipation Factor} \\ \text{ESC} &= \text{Equivalent Series Capacitance} (\text{F}) \\ f &= \text{Frequency} (\text{Hz}) \end{aligned}$$

The tolerance limits of the rated capacitance must be taken into account when calculating this value .

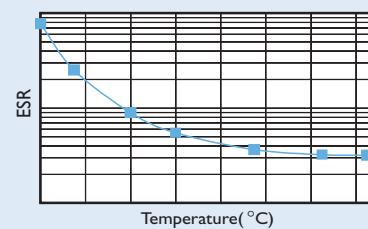

Fig. I-9 ESR change vs. temperature

The resistance of the electrolyte decreases strongly with increasing temperature.

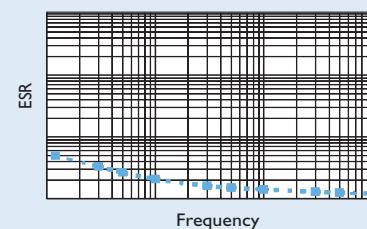

Fig. I-10 ESR change vs. frequency

4. Impedance (Z)

The impedance of an electrolytic capacitor results from here below circuit formed by the following individual equivalent series components :

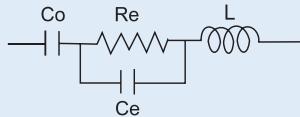

Fig. I-11

C_o = Aluminum oxide capacitance (surface and thickness of the dielectric).

R_e = Resistance of electrolyte and paper mixture (other resistances not depending on the frequency are not considered : tabs , plates ,and so on).

C_e = Electrolyte soaked paper capacitance.

L = Inductive reactance of the capacitor winding and terminals.

The impedance of an electrolytic capacitor is not a constant quantity that retains its value under all the conditions : it changes depending on the frequency and the temperature .

The impedance as a function of frequency (sinusoidal waveform) for a certain temperature can be represented as follows :

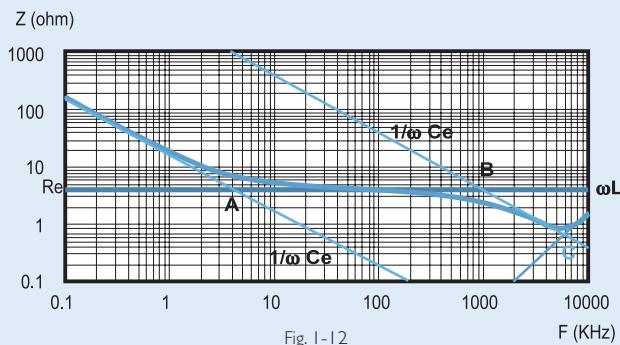

Fig. I-12

- Capacitive reactance predominates at low frequencies

- With increasing frequency , the Capacitive reactance $X_C=1/\omega$ Codecreases until it reaches the order of magnitude of the electrolyte resistance R_e (A)

- At even higher frequencies , the resistance of the electrolyte predominates : $Z=R_e$ (A - B)

- When the capacitor's resonance frequency is reached (ω_0) , capacitive and cancel each other $1/\omega$ Inductive reactance mutually cancel each other $1/\omega C e = \omega L$, $\omega_0 = \sqrt{1/LC}$.

- Above this frequency , the inductive reactance of the winding and its terminals ($X_L=Z=\omega L$) becomes effective and leads to an increase in impedance .

Generally speaking it can be estimated that $C_e \approx 0.01 C_o$.

The impedance as a function of frequency (sinusoidal waveform) for different temperature values can be represented as follows (typical values) :

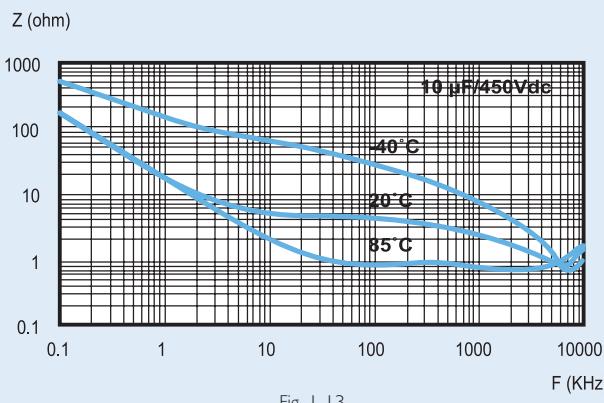

Fig. I-13

R_e is the most temperature dependant component of electrolytic capacitor equivalent circuit .The electrolyte resistivity will decrease if the temperature rises . In order to obtain a low impedance value all over the temperature range , R_e must be as little as possible , but too low R_e values means a very aggressive electrolyte and then a shorter life of the electrolytic capacitor at the high temperatures .A compromise must be reached .

5. Leakage current (L.C.)

Duettothealuminum oxidelayer that serves as adielectric , a small current will continueto flow even after a DC voltage has been applied for long periods . This current is called leakage current . A high leakage current flows after applying a voltage to the capacitor and then decreases in few minutes (e.g. after a prolonged storage without any applied voltage) . In the course of the continuous operation ,the leakage current will decrease and reach an almost constant value .

After avoltage free storage the oxide layer may deteriorate , especially at high temperature . Since there are no leakage current to transport oxygen ions to the anode , the oxide layer is not regenerated . The result is that ahigher thannormal leakagecurrent will flow whenavoltageis appliedafter prolongedstorage . As the oxide layer is regenerated in use , the leakage current will gradually decrease to its normal level .

The relationship between the leakage current and the voltage applied at constant temperature can be shown schematically as follows :

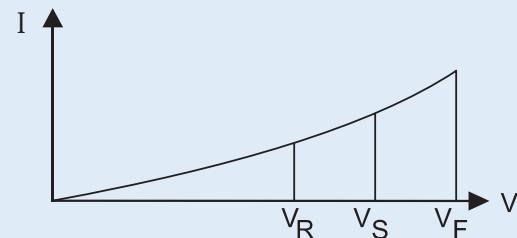

Fig. I-14

Where :

V_F = Forming voltage

If this level is exceeded a large quantity of heat and gas will be generated and the capacitor could be damaged .

V_R = Rated Voltage

This level represents the top of the linear part of the curve .

V_S = Surge voltage

It lies between V_R and V_F : the capacitor can be subjected to V_S for short periods only .

I-5 Reliability

(1) The bathtub curve:

Aluminum electrolytic capacitors feature failure rates shown by the following bathtub curve.

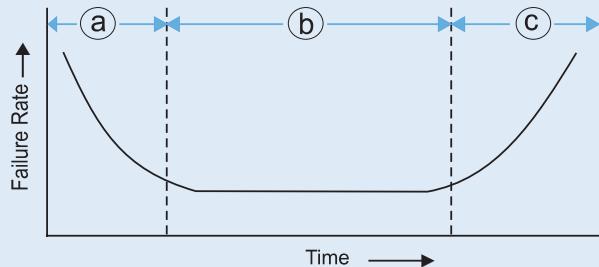

Fig.I-15 Bathtub curve

a. Initial failure period

Deficient Capacitors include any products before dispatch that may have some deficiency caused by the design, production process or used in inappropriate environments.

b. Random failure period

The capacitors have a low defect ratio in the period after it has been stabilized.

c. Wear out failure period

The performance of capacitors will decrease with an increase in usage period. The malfunction rate may vary due to the structural design.

(2) Failure types: (See Table-I)

a). Completely malfunction:

Capacitor is completely disabled to all functions, e.g.: short circuit, open circuit.

b). Malfunction cause by wear and tear gradual malfunctioning of the capacitor, the cause of the malfunction would depend on the environmental conditions.

I-6 Life of the Electrolytic Capacitors

A affects by using condition for the life of electrolytic capacitors which environmental condition & electrical condition .

Environmental condition include temperature , humidity , atmospheric

pressure & vibration ...etc. and mostly affected by temperature factor . Electrical condition include voltage , ripple current and charge / discharge condition ...etc.

I. Temperature & Life

The reduce capacitance & increase DF will be created by the influence from temperature on the life, such condition mostly caused by a slow evaporation from the electrolyte to seal position; the electric specificity that is affected by timing and surrounding temperature as following formula below and similar to the chemical kinetics of Arrhenius' rule and to be reputed as the connection rule of life in electrolytic capacitors.

$$L_x = L_0 \times B^{\frac{T_0 - T_x}{10}} \quad \text{Eq.1}$$

L_x : Expected Life at Operating Temperature T_x °C (hour)

L_0 : Load Life at Maximum Operating Temperature T_0 °C (hour)

To: Maximum Operating Temperature (°C)

T_x : Actual Operating Temperature. (°C)

B: Accelerate Coefficient of Temperature(≈ 2)

From the Eq.1 , it means about double acceleration for temperature raising at 10 C . Therefore , it comes a longer working life once a temperature setting lower than T_x while products design .

2. Rated Voltage and Life

While working , the voltage under the input of rated voltage and for the reducing of voltage, although with little or more influence to electrolytic capacitors but, no necessary for special concern after compare with the influence by temperature.

3. Influence of Input Ripple Current Against Working life

Passing of some ripple current when the electrolytic capacitor has a wave filter or smoothing function, the internal temperature of electrolytic capacitor will bring some more influence to working life as well. Hence, a maximum ripple current will be listed caused by such ripple current and directly specified by each manufacturer; it has been considered as a overlapping by DC voltage & AC voltage when incorporate electrolytic capacitors with a power that ripple current included. The losing electronic power caused by the alternate resistance & direct leakage current inside the electrolytic capacitors will be come to heat. Kindly refer to following for relation between in rated ripple current and temperature raising:

$$W = (I_{\text{Ripple}})^2 \cdot R_{\text{ESR}} + V \cdot I_{\text{Leakage}} \quad \text{Eq.3}$$

where W: Internal power loss

I Ripple : Ripple current

R ESR: Equivalent Series Resistance

V : Applied voltage

I Leakage: Leakage current

Normally the losing voltage power of DC leakage current that caused by the DC voltage which to be inflicted in the electrolytic capacitor will be lower than a losing voltage power caused by ripple current, therefore:

$$W = (I_{\text{Ripple}})^2 \cdot R_{\text{ESR}} \quad \text{Eq.4}$$

The formula for reaching of temperature balance on the internal temperature raising as well as the hot dissipation as below:

$$W = (I_{\text{Ripple}})^2 \cdot R_{\text{ESR}} = \beta \cdot A \cdot \Delta T \quad \text{Eq.5}$$

β : Heat radiation constant

A = Surface area of container (cm^2)

$\beta = \pi/4 \cdot D \cdot (D + 4L)$

D: case diameter (cm)

L: case length (cm)

ΔT : Temperature raising created by internal heating ($^{\circ}\text{C}$).

Through the formula above can see the temperature raising caused by the ripple current and:

$$\Delta T = \frac{(I_{\text{Ripple}})^2 \cdot R_{\text{ESR}}}{\beta A} = \frac{(I_{\text{Ripple}})^2 \cdot \tan \delta}{\beta A \omega C} \quad \text{Eq.6}$$

Due to: $R_{\text{ESR}} = \frac{\tan \delta}{\omega C}$

Tan δ : DF at 120Hz

w : $2 \pi f$ ($f = 120\text{Hz}$)

C : The static capacity (F) at 120Hz

In general, the allowed ripple current value would be specifically listed by the manufacturer - A revised coefficient of allowed ripple current & working frequency to the electrolytic capacitor.

Circuit Board Cleaning

I. Foreword

When a halide substance seeps into the aluminum electrolytic capacitor The halide dissolves and frees halogen ions.

Also the following reaction can occur

When this reaction is repeated. The leakage current increases and the safety vent will be activated and may lead to open vent. Because of this halogen type cleaning agents or adhesive material and coating material is not recommended for usage. The following explains the recommended condition for cleaning. When a halogen type cleaning agent will be used due to cleaning capabilities.

2. Recommended Cleaning Condition

Applicable : Any type, any ratings

Cleaning Agents : Pine Alpha ST-100S

Clean Through 750H, 750L, 710M

Sanelek B-12

AquaQ Cleaner 210 SEP

Techno Care FRw 14 ~ 17

Isopropyl Alcohol

Cleaning Conditions : Total cleaning time shall be no greater than 5 minutes by immersion, ultrasonic or other method.

After cleaning, capacitors should be dried using hot air for minimum of 10 minutes along with the PC board.

Hot air temperature should be below the maximum operating temperature of the capacitor.

Insufficient dries after water runse may cause appearance problems, such as sleeve shrinking, bottom-plate bulging.

It is recommended to monitor conductivity, pH, and concentration of the agent. Please do not keep a product after cleaning in condition that cleaning agents exists as steam, or in non-ventilated containers.

3. CFC substitute

The anti-solvent capacitor listed in the catalogue can be cleaned using AK-255AES. If used within the following condition.

Please monitor contamination of solution by measuring conductivity, pH, specific gravity, water content and such.

Furthermore, do not store capacitors in a cleaning agent atmosphere or sealed container after cleaning.

Also avoid using ozone-depleting substances for cleaning agents in difference to our global environments.

Applicable : Anti-solvent capacitors

Cleaning Agents : AK-255AES

Cleaning Conditions : Within 5 minutes, total cleaning time by immersion, vapor spray, or ultrasonic and such. For SMD and ultra-miniature type 2 minutes maximum of total cleaning time.

4. Fixing Material and Coating Material

- DO not use any affixing or coating materials, which contain halide substance.

- Remove flux and any contamination, which remains in the gap between the end seal and PC board.

- Remove flux and any contamination, which remains in the gap between the end seal and PC board.

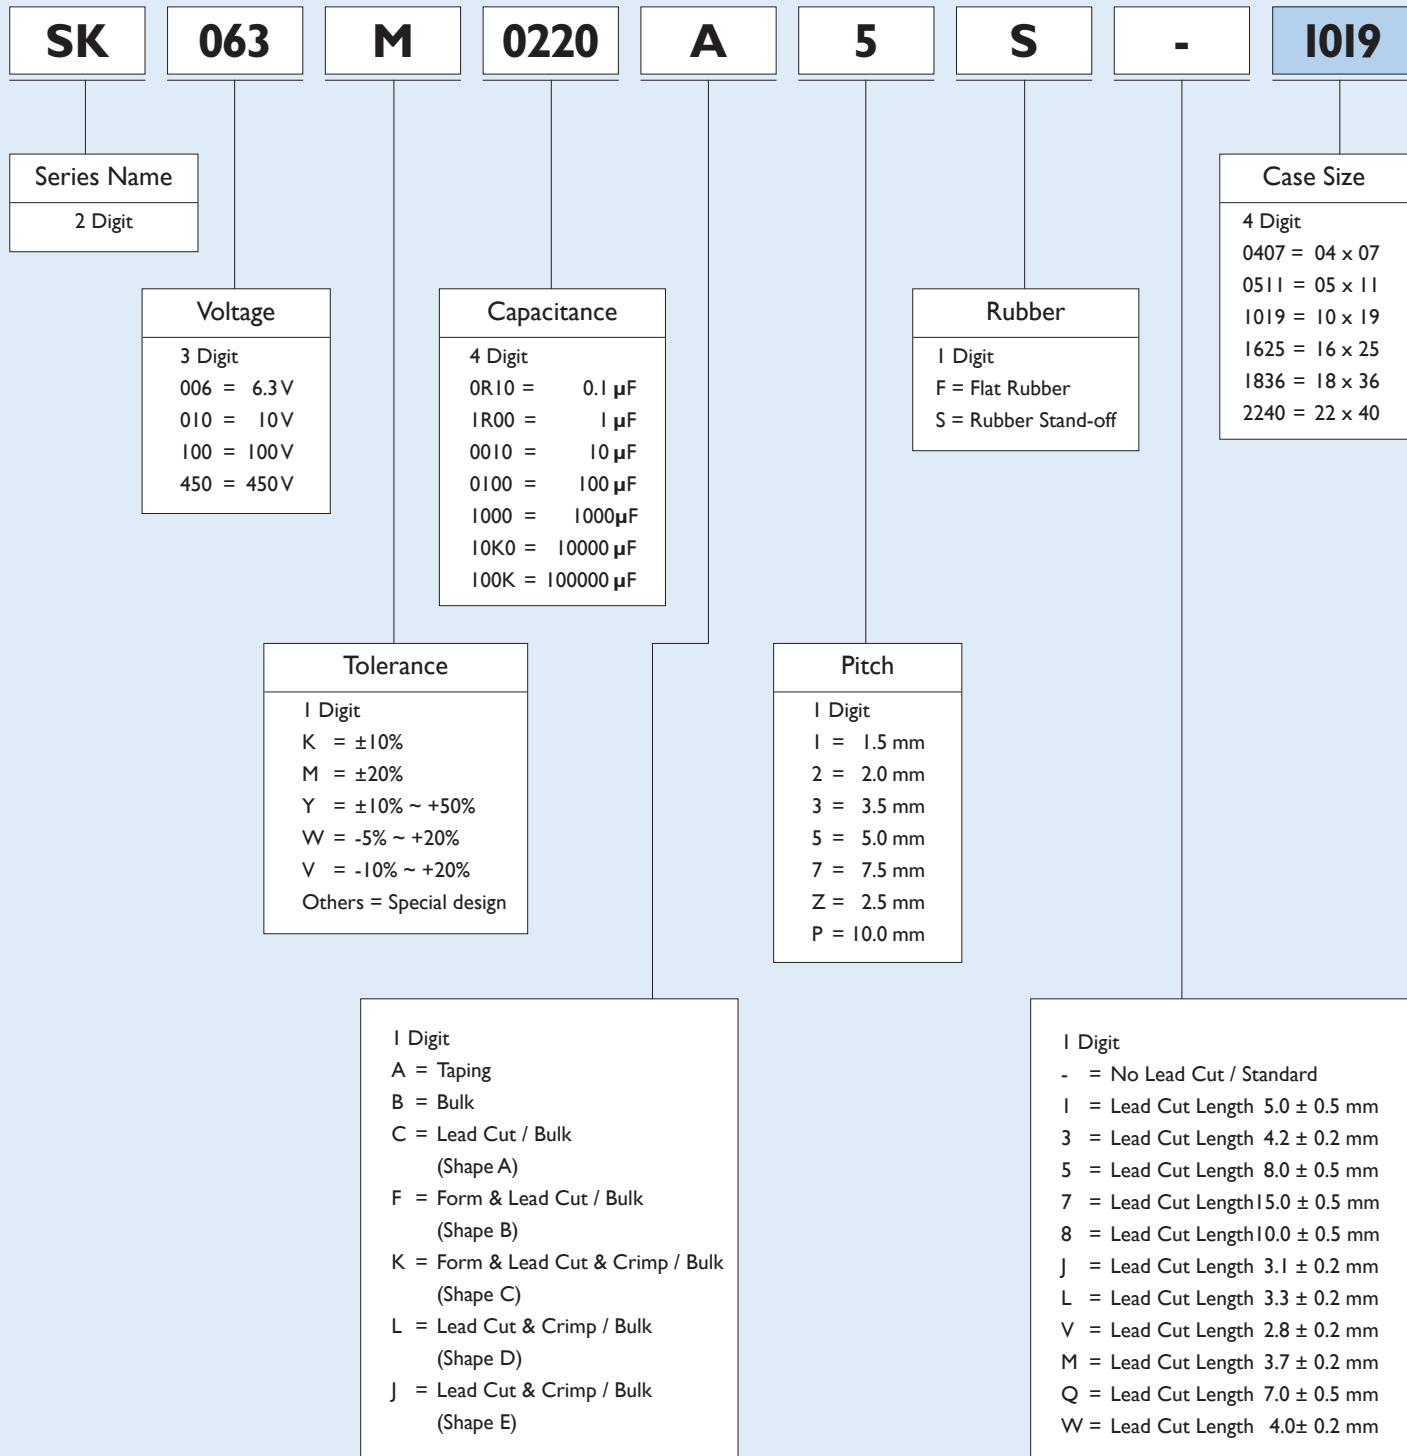

- Please dry the cleaning agent on the PC board before using affixing or coating material.

- Please do not apply any material all around the end seal when using affixing or coating material.

There are variations of cleaning agents, fixing and coating material, so please contact those manufacturer or our sales office to make sure that the material would not cause any problems.

DETAILS OF CARRIER TAPE

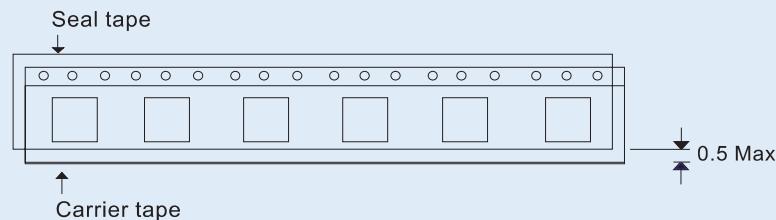

(1)

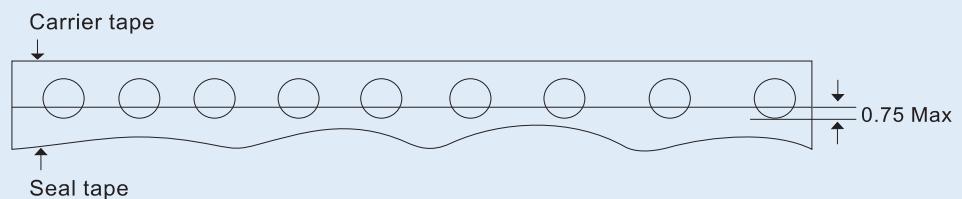

- a. Last reeling empty part of carrier tape shall be more than.10 cm
- b. Leader part of seal tape shall be more than 20 cm.
- c. First reeling Empty part of carrier tape shall be more than.10 cm
- d. Adhesive tape fixing the end of the leader part shall be approx.10 cm

(2) Deviation between carrier tape and seal tape

- a. Deviation between carrier tape and seal tape shall be less than 0.5 mm.

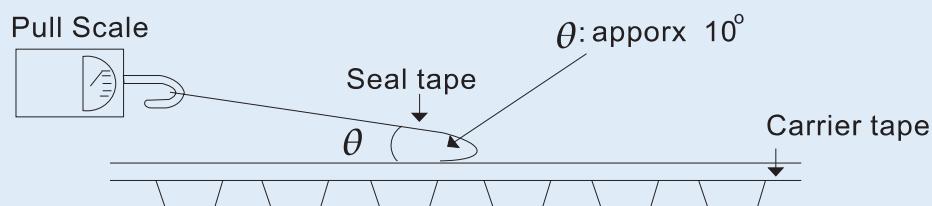

- b. Seal tape shall not cover on the feeding holes more than 0.75 mm.

ADHESION TEST

Reasonable pulling strength: 0.1~0.7N
 Pulling speed: 300mm / min

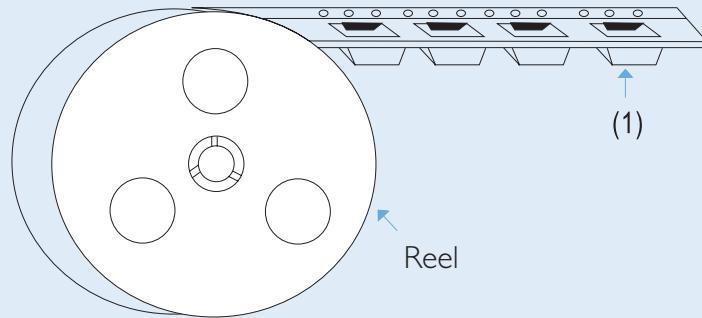

PACKING STYLE

(1) Carrier tape shall be reeled inside.(seal tape shall be outside)

(2) End of the tape shall be inside to the reel physically as shown in the below figure and leader part of seal tape shall not be attached.

Reflow soldering for chip capacitors

(1) For reflow, use a thermal conduction system such as infrared radiation (IR) or hot blast. Vapor heat transfer systems (VPS) are not recommended.

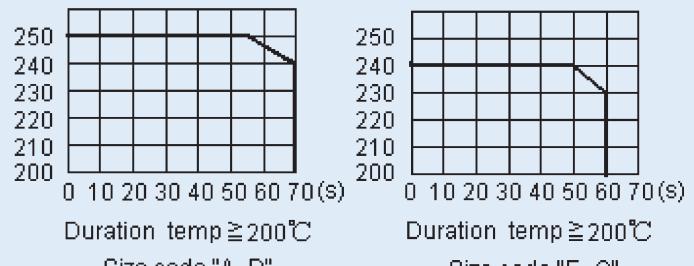

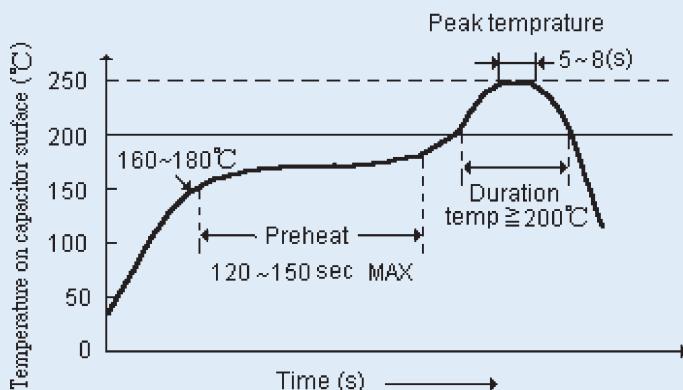

(2) Observe proper soldering conditions (temperature, time, etc.). Do not exceed the specified limits.

(3) Reflow should be performed one time. Consult us for additional reflow restrictions.

(4) Reflow soldering profile for standard :

(5) Reflow soldering profile for lead free :

■ Manual Soldering

(1) Observe temperature and time soldering specifications or do not exceed temperatures of 300°C for 3 seconds or less.

(2) If a soldered capacitor must be removed and reinserted, avoid excessive stress on the capacitor leads.

■ Capacitor handling after soldering

(1) Avoid moving the capacitor after soldering to prevent excessive stress on the lead wires where they enter the seal.

(2) Do not use the capacitor as a handle when moving the circuit board assembly.

(3) Avoid striking the capacitor after assembly to prevent failure due to excessive shock.

(c) Leakage Current : Not Exceed 200% of Initial Requirement

DESCRIPTION

The S5 series are smaller than SS series.

This type is designed for saving space and high density insertion.

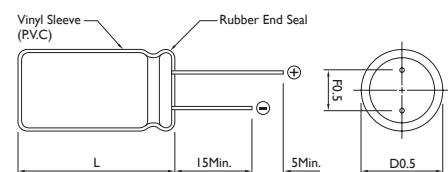

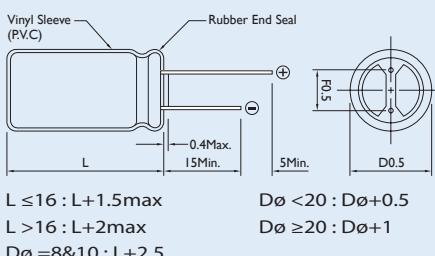

Applications : VTR, Camera, Car Audio, Miniaudio and Other Industrial and Commercial Applications

Miniature Aluminum Electrolytic Capacitors

DESCRIPTION

Features: 105°C 1000 hours

Features: For general purpose coupling, decoupling, by pass, and filtering circuit in entertainment electronics.

SE-K [For General]

105°C Single-Ended Lead Aluminum Electrolytic Capacitors Rated Voltage up to 450V

ELECTRICAL CHARACTERISTICS

Operating Temperature : -40~+105°C / -40~+105°C / 25~+105°C

Working Voltage : 6.3~100V / 160~250V / 350~450V

Rate Capacitance Range : 0.47 ~ 15000μF / 0.47~470 μF 0.47~105 μF

Capacitance Tolerance : +/-20% at 120Hz, 20°C

DC Leakage Current (μA) : $I = 0.01CV + 3 / 0.03CV + 10$
(whichever is greater, (After rated voltage applied for 2 minutes))

Dissipation Factor : at 120 Hz, 25°C

$\tan \delta$	0.26	0.22	0.18	0.16	0.14	0.12	0.10	0.15	0.20

Endurance : After applying rated voltage for 1000 hours at 105°C the capacitors shall meet the following requirements.

- (a) Capacitance Change : Within 20% of Initial Value
- (b) Dissipation Factor : 200% or less of initial specified value
- (c) Leakage Current : initial specified value or less

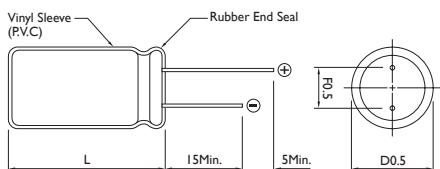

Shelf Life : After leaving capacitors under no load at 105°C for 500 hours. the capacitors shall meet the same requirement as Endurance.

105°C Single-Ended Lead Aluminum Electrolytic Capacitors
for the Rated Voltage up to 450V

Miniature Aluminum Electrolytic Capacitors

ELECTRICAL CHARACTERISTICS

Operating Temperature : -40° ~ +105°C / -25° ~ +105°C

Working Voltage : 6.3 ~ 100V / 160 ~ 450V

Rate Capacitance Range : 0.47 ~ 15000μF / 0.47~470

Capacitance Tolerance : -20 ~ +20%

DC Leakage Current (μA) : 0.01CV +3 / 0.03CV+10

(Measurements shall be made after a 2 minute charge at rated working voltage at 25°C)

Dissipation Factor : at 120 Hz, 25°C

WV (V) :	6.3	10	16	25	35	50	63 ~ 100	160 ~ 250	350 ~ 450
DF (%) :	26	22	18	16	14	12	10	15	20

For capacitor whose capacitance exceeds 1000μF. The value of DF(%) is increased by 2% for every addition of 1000μF.

Miniature Aluminum Electrolytic Capacitors

DESCRIPTION

Used in where low leakage current is essential as in coupling of pre-amplifiers.

Very low leakage current remains even after prolonged storage.

SJ [Low Impedance and High Ripple Series]

Features: 105°C 1000~5000hours, Low impedance and high ripple

Recommended Applications: AV(TV, Video, Audio), Monitor/Computer, OA/HA/
Communication, Converter/Inverter, Adapter, SMPS

Miniature Aluminum Electrolytic Capacitors

ELECTRICAL CHARACTERISTICS

Operating Temperature : -40° ~ +105°C

Working Voltage : 6.3 ~ 100V

Rate Capacitance Range : 5.6 ~ 6800μF

Capacitance Tolerance : -20 ~ +20%

DC Leakage Current (μA) : $I = 0.01 CV(\mu A)$ or 3μA Whichever is greater.

Dissipation Factor : at 100KHz, 105°C

WV (V) :	6.3	10	16	25	35	50	63	100
D.F (%) :	22	19	16	14	12	10	9	8

For capacitor whose capacitance exceeds 1000μF. The value of D.F(%) is increased by 2% for every addition of 1000μF.

WV (V)	6.3	10	16	25	35	50	63	100
Impedance : Z - 25°C / Z + 20°C	2	2	2	2	2	2	2	2
Z - 40°C / Z + 20°C	3	3	3	3	3	3	3	3

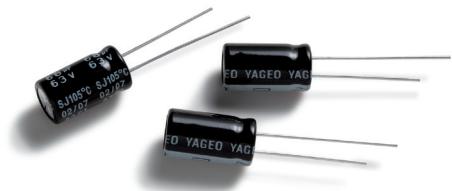

After applying rated voltage with max ripple current for 1000~5000 hours at 105°C, the capacitor shall meet the following requirement.

(a) Capacitance Change: Within $\pm 25\%$ of the initial value

(b) Dissipation Factor: Not more than 200% of the specified value

(c) Leakage Current: Not more than the specified value

After placed at 105°C without voltage applied for 1000 hours (500 hours for L=7), the capacitor shall meet the same requirement as Endurance.

DESCRIPTION

Features: 105°C 1000~5000hours, Low impedance and high ripple

Endurance	After applying rated voltage with rated Ripple current for 2000hrs at 85°C, the capacitor shall meet the following requirements.	
	Capacitance Change	Within 20% of the Initial Value
	Dissipation Factor	200% or less of initial specified value
	Leakage Current	initial specified value or less
Shelf Life	After placed at 85°C without voltage applied for 1000 hours, the capacitor shall meet the same requirement as Endurance. 25°C	

DESCRIPTION

Endurance : 85°C 2000 hours

Large Can Aluminum Electrolytic Capacitors

LG [For 105°C, 2000 Hours General]

For Printed Circuit Board High-Performance Aluminum Electrolytic Power Supply Input and Output Filter Capacitors

DESCRIPTION (LG Series 105°C 2000 Hours Assured)

Endurance : 105°C 2000 hours, high temperature than LH.

Ideally suitable for using in Switching Power Supplies and other industrial / commercial applications.

Endurance	After applying rated voltage with rated Ripple current for 2000hrs at 105°C, the capacitor shall meet the following requirements.							

Capacitance Change	≤ ±20% of the Initial Value
D.F	≤ 200% of the Initial Specified Value
Leakage Current	≤ the Initial Specified Value
Shelf Life	After placed at 105°C without voltage applied for 1000 hours, the capacitor shall meet the same requirement as Endurance.

	Dissipation Factor (tan δ) shall not exceed the values showed in the table of standard rating	
Endurance	Leakage current : Not more than the specified value	
	Capacitance Change : Within +/-20% of the initial value	
	Dissipation Factor : Not more than 200% of the specified value	
Shelf Life 25°C	After placed at 105°C without voltage applied for 1000 hours, the capacitor shall meet the same requirements as Endurance.	

DESCRIPTION

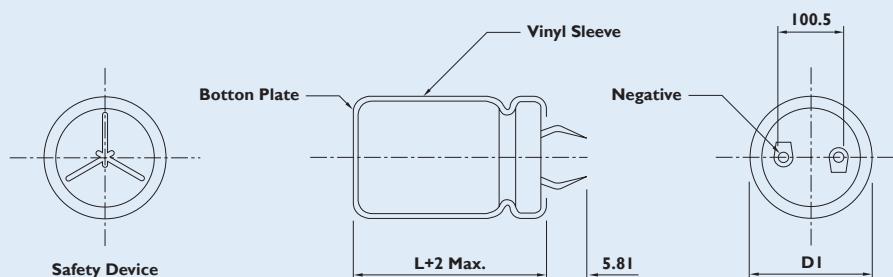

(LG Series 105°C 3000 Hours Assured)

Features : 105°C 3000 hours, Wide temperature range for LF, Longer life than LG, Snap-in terminal, High ripple current.

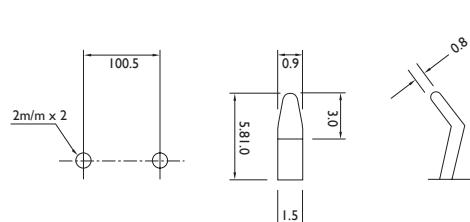

Recommended Applications : Smoothing circuit, TV/Monitor, Adapter, SMPS.

$Z - 55^\circ\text{C} / Z + 20^\circ\text{C} \leq 1.25$

After applying rated voltage for 2000 hours at 105°C, the capacitors shall meet the follow requirements.

- (a) Capacitance Change: Within $\pm 20\%$ of Initial Value
- (b) Dissipation Factor: Not more than 150% of the initial specified value
- (c) Equivalent Series Resistance: Not more than 150% of the initial specified value
- (d) Leakage Current: Not more than the initial specified value

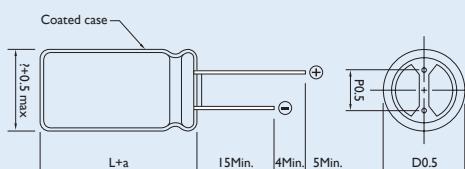

DESCRIPTION

Long life for 2,000 hours at 105°C, ideally suited for high quality and high reliability applications.
